

MULTI-MODE POWER SUPPLY DEVICE OF WIRELESS EARPHONE

FIELD OF THE INVENTION

5 The present invention relates to wireless earphones, and particularly to a multi-mode power supply device of a wireless earphone which has auxiliary power supplies.

BACKGROUND OF THE INVENTION

10 For those communicating and working by phones, an earphone is a necessary device so that they are unnecessary to hold the handset by one hand since this will make the workers feel inconveniently. In general, the earphone has a battery set as a power supply. However the working period of a battery set is not so long so as to satisfy the requirement of
15 users. In general, the working time period of the battery set is about 2 to 3 hours. Furthermore, it must take time to charge the battery set with a time period. When the power of the battery set approaches to a used up period, the signals from the earphone will become weak and thus the user cannot hear the sound from the earphone clearly. Moreover, in charging
20 the battery set of the earphone, the earphone is placed on a charger for a time period of at least 2 hours. In this time period, the earphone cannot be used. If the battery set is charged frequently, the lifetime of the battery set will reduce so that the earphone having the battery set will be deserted as the exhaustion of the battery set. Thus, in the prior art, the
25 earphone is used as a consuming product, namely, the user must replace

the earphone frequently for matching a coupled phone. Thereby the prior art is not only inconveniently, but also is uneconomic.

SUMMARY OF THE INVENTION

5 Accordingly, the primary object of the present invention is to provide a multi-mode power supply device of a wireless earphone; the earphone being communicable bi-directionally with portable communication devices wirelessly through an antenna; the earphone having a battery set; at least one side of the earphone; an internal of the earphone having a power
10 management circuit; the battery set supplying power to the power management circuit; the power management circuit being used to control the power on or off. The communication devices are selected from portable mobile phones and vehicle used phones.

 Furthermore, a suspender is capable of being inserted into or buckled
15 into the groove of the earphone so that the suspender is positioned at one side of the power supply module; the suspender has a power supply module; when the suspender is combined to the earphone, the power management circuit is electrically connected to the power supply module.

 In application, the suspender with the power supply module has a
20 simple structure and a low cost. It likes a peripheral of a mobile phone. More than one suspender can be prepared. When one is exhausted, the others can be used so that the earphone is used continuously. The one updated is charged by a charger. Thereby the communication time is continuously with a high quality. The power management circuit is
25 prepared with a check loop which serves to prevent power from flowing

along a reverse direction so as to protect the components within the earphone.

The various objects and advantages of the present invention will be more readily understood from the following detailed description when read
5 in conjunction with the appended drawing.

BRIEF DESCRIPTION OF THE DRAWINGS

Fig. 1 is a schematic view showing the discharging curve of a battery set in the prior art.

10 Fig. 2 shows a front view and a lateral view of the earphone according to the present invention.

Fig. 3 is an assembled perspective view of the present invention.

Fig. 4 shows the circuit block diagram of the present invention.

Fig. 5 shows an application of the present invention.

15

DETAILED DESCRIPTION OF THE INVENTION

In order that those skilled in the art can further understand the present invention, a description will be described in the following in details. However, these descriptions and the appended drawings are only used to
20 cause those skilled in the art to understand the objects, features, and characteristics of the present invention, but not to be used to confine the scope and spirit of the present invention defined in the appended claims.

With reference to Fig. 2 to 4, the multi-mode power supply device of a wireless earphone of the present invention is illustrated. The earphone 1
25 has a receiving unit 11 and a transmitting unit 12. The earphone 1 is

communicable bi-directionally with portable communication devices (not shown) wirelessly through an antenna 13. The earphone 1 has a preset battery set 14. At least one side of the earphone 1 has a groove 15. An internal of the groove 15 has a power management circuit 16. The
5 battery set 14 supplies power to the power management circuit 16. The power management circuit 16 serves to control the power on or off.

A suspender 2 is capable of being inserted into or buckled into the groove 15 of the earphone 1 so that the suspender 2 is positioned at one side of the power supply module 20. The suspender 2 has a power supply
10 module 20. It is preferably that the power supply module 20 is chargeable batteries. When the suspender 2 is combined to the earphone 1, the power management circuit 16 is electrically connected to the power supply module 20. Thereby, the battery set 14 and the power supply module 20 are integrated for supplying power to the earphone 1. Thus,
15 the power supply to the earphone 1 is enlarged so that the communication and standby time of the earphone 1 are prolonged.

Furthermore, as shown in Fig. 5, in application, the suspender 2 with the power supply module 20 has a simple structure and a low cost. It likes a peripheral of a mobile phone. More than one suspender 2 can be
20 prepared. When one is exhausted, the others can be used so that the earphone 1 is used continuously. The one updated is charged by a charger 3. Thereby the communication time is continuously with a high quality.

With reference to Fig. 4, the power management circuit 16 is prepared
25 with a check loop 161 which serves to prevent power from flowing along a

reverse direction so as to protect the components within the earphone 1.

In the present invention, the battery set may be a lithium battery set.

The present invention is thus described, it will be obvious that the same may be varied in many ways. Such variations are not to be regarded
5 as a departure from the spirit and scope of the present invention, and all such modifications as would be obvious to one skilled in the art are intended to be included within the scope of the following claims.
